

Auto Ticket Classification using Flow Designer

Requirement Analysis – Functional & Non-functional Requirements, User Stories

Prepared from the project details available in this conversation and the supplied template archive. Unknown details are marked rather than assumed.

Project details

Project Name: Auto Ticket Classification using Flow Designer

Team ID: Not provided

Date: 01 October 2026

Functional requirements

FR-1 Ticket creation: A user/helpdesk operator can create an Incident Workflow record with caller and issue description.

FR-2 Automatic classification: On record creation, the flow checks the short description and updates Category/Subcategory for supported issue keywords.

FR-3 Wi-Fi/Network: If description contains “Wi-Fi” or “Network”, set Category=Network and Subcategory=Wi-Fi.

FR-4 Projector: If description contains “Projector”, set Category=Hardware and Subcategory=Projector.

FR-5 Password: If description contains “Forgot password”, set Category=Access and Subcategory=Forgot Password.

FR-6 Slow computer: If description contains “Slow Computer”, set Category=Performance and Subcategory=Slow Computer.

FR-7 Email: Send a ticket confirmation email to Caller.Email with subject “Your Request for the issue has been submitted” and configured body “Ticket confirmation message”.

Non-functional requirements

Usability: Simple record form and automatic field population.

Security: Use ServiceNow roles/ACLs and reference fields; only authorized users should access records/configuration.

Reliability: Flow should run on record creation and apply configured conditions consistently.

Performance: Keep the flow logic limited to description checks and record update.

Availability: Depends on the availability of the ServiceNow instance.

Scalability: Additional issue keywords/branches can be added to the flow.

User stories

USN-1 (Helpdesk): As a helpdesk operator, I can create a ticket with caller and short description so the issue is recorded.

Acceptance: Incident Workflow record is saved.

USN-2 (Helpdesk): As a helpdesk operator, I want supported issue descriptions classified automatically.

Acceptance: Correct configured category/subcategory is populated after save/reload.

USN-3 (Caller): As a caller, I want a confirmation email after ticket submission.

Acceptance: Email record is generated for Caller.Email.

USN-4 (Admin): As an administrator, I want to maintain the flow and choices.

Acceptance: Flow and choice configuration can be updated in ServiceNow.

Scope / assumptions

Scope is limited to the four configured keyword categories and the ServiceNow Incident Workflow custom table. Classification depends on configured text matching; synonyms, spelling variations, and ambiguous descriptions may require manual handling. Team ID and named tester were not provided.
