

Auto Ticket Classification using Flow Designer

Project Design – Proposed Solution & Problem–Solution Fit

Prepared from the project details available in this conversation and the supplied template archive. Unknown details are marked rather than assumed.

Project details

Project Name: Auto Ticket Classification using Flow Designer

Team ID: Not provided

Date: 01 October 2026

Problem to be solved

School IT helpdesk staff manually classify common support tickets, which can consume time and result in inconsistent category/subcategory selection.

Idea / solution description

A ServiceNow custom Incident Workflow table and Flow Designer flow classify new tickets using configured keywords in Short Description. The flow updates Category/Subcategory and generates a confirmation email to the caller.

Novelty / uniqueness

The solution applies maintainable no-code/low-code workflow automation within ServiceNow to a school IT helpdesk use case. It combines classification and email confirmation in the ticket-creation process.

Social impact / customer satisfaction

Potentially reduces repetitive work for helpdesk staff and provides callers with a confirmation message. These are intended benefits; no measured user-satisfaction study was provided.

Business model / revenue model

Internal operational tool; no direct revenue model is defined. Potential value is reduced manual effort and more consistent ticket handling.

Scalability

Additional categories, keywords, routing rules, and notifications can be added to Flow Designer and table choices, subject to testing and access controls.

Problem-solution fit

The workflow addresses the stated manual classification problem by automating four defined issue types. Fit is demonstrated in the configured test scenarios; broader effectiveness would require testing with real-world wording and users.
